PROPERTY INSPECTION REPORT — PROPERTY A

Fictional sample inspection | Cedar Residency, Flat A-204

1. Inspection scope and limitations

This sample report demonstrates how an inspection document can be indexed and queried by a RAG application. It describes a fictional visual walkthrough of a residential apartment and is not the result of a real site visit.

Illustrative inspection date: 15 December 2025. Areas considered include the entrance, walls, floors, windows, kitchen, bathrooms, electrical fixtures, plumbing, ventilation, and common access. No specialist testing, destructive investigation, structural engineering assessment, or laboratory analysis is represented.

A real inspection should identify the inspector, date and time, weather or access limitations, areas not inspected, equipment used, photographs, and any urgent safety concerns.

2. General interior condition

The fictional unit is described as being in generally serviceable cosmetic condition, with painted walls and tiled floors. Small paint scuffs near the living-room doorway and minor marks on one bedroom wall are recorded as cosmetic observations.

No conclusion about hidden moisture, structural integrity, waterproofing, or pest activity can be drawn from this illustrative visual description. Staining, unusual odors, or recurring dampness should be investigated by a qualified professional.

Recommended action: photograph each room before possession and prepare a signed condition inventory. Record existing scratches, chips, stains, cracks, and missing items to avoid later disagreement about responsibility.

3. Doors, windows, and security

The main door is described as opening and closing during the hypothetical walkthrough. The report recommends checking the latch, lock cylinder, door frame, and any safety chain. Bedroom doors and window handles should also be tested.

Window glass and frames should be checked for cracks, loose fittings, water ingress, and safe operation. Balcony railings, if present, should be inspected for secure fixings and appropriate height by a qualified person if there is any concern.

Recommended action: replace defective locks or broken glass promptly, and do not treat this sample as confirmation that any real lock, railing, or window is safe.

Important notice: All observations are fictional examples for testing only. This is not a real inspection, engineering certificate, electrical safety certificate, or guarantee of property condition.

PROPERTY INSPECTION REPORT — PROPERTY A (continued)

Illustrative sample for a fictional property

4. Kitchen and plumbing

The fictional kitchen includes a sink, countertop, storage cabinets, and space for a cooking appliance. The sample notes no confirmed active leak during the hypothetical visual check, but it does not represent a pressure test or a sustained leak test.

Before move-in, run taps, inspect under the sink, check drainage speed, look for cabinet swelling, and confirm that gas or electrical cooking connections are safe and installed by qualified personnel. Do not operate an unfamiliar or visibly damaged gas connection.

Recommended action: record appliance make, model, and condition if appliances are included. Clarify who must maintain or repair each appliance in the rental agreement.

5. Bathrooms and ventilation

The sample unit is described as having two bathrooms with tiled surfaces, washbasins, toilets, taps, and shower fittings. The inspection checklist should look for dripping taps, slow drains, loose fixtures, damaged grout, visible mold, and signs of water leakage.

Bathroom exhaust fans or windows should be checked for ventilation. A brief visual inspection cannot establish waterproofing quality or rule out concealed leakage to neighboring units.

Recommended action: report persistent dampness, ceiling discoloration, or water seepage to the owner or building manager and seek qualified assessment where needed.

6. Electrical and life-safety observations

The illustrative report recommends testing accessible light switches, sockets, fans, and the distribution-board cover without opening electrical equipment. Any burning smell, exposed wire, sparking, or overheating should be treated as an urgent issue and assessed by a licensed electrician.

Smoke alarms, fire extinguishers, emergency exits, stairways, and common-area fire-safety equipment should be checked against building requirements. This sample does not certify compliance with fire or electrical codes.

Recommended action: do not overload outlets or use damaged cords. Ask the building manager how to report emergencies and where the safe exit routes are located.

Important notice: All observations are fictional examples for testing only. This is not a real inspection, engineering certificate, electrical safety certificate, or guarantee of property condition.

PROPERTY INSPECTION REPORT — PROPERTY A (continued)

7. Fixtures, finishes, and inventory

The sample inventory may include two ceiling fans, LED lights, kitchen cabinets, bathroom mirrors, taps, and a water heater if present. Each item should be marked as present, missing, damaged, or not tested, with a photograph where possible.

Floor tiles should be checked for cracks or movement; cabinet hinges for loose screws; and wall finishes for damage. Normal wear should be distinguished from damage beyond ordinary use in a fair, documented manner.

8. Findings and recommended priorities

Priority 1 — Safety: have any exposed wiring, unstable railing, gas odor, or blocked emergency route checked immediately by a qualified professional.

Priority 2 — Water ingress: investigate active leaks, persistent dampness, or ceiling stains before occupancy.

Priority 3 — Functionality: document lock operation, taps, drains, lights, fans, and supplied appliances.

Priority 4 — Cosmetic items: record paint scuffs and minor surface marks in the move-in inventory.

9. Handover checklist

- Photograph each room and any existing damage with dates where practical.
- Record keys, access cards, parking tags, and items handed over.
- Record meter readings and any known pending utility bills.
- Send a copy of the signed condition inventory to both parties.
- Track each repair request, responsible person, and completion date.

An inspection report should state what was observed, what was not tested, and which items require professional follow-up. It should not make unsupported guarantees about the property.

Important notice: All observations are fictional examples for testing only. This is not a real inspection, engineering certificate, electrical safety certificate, or guarantee of property condition.
