PROPERTY INSPECTION REPORT — PROPERTY B

Fictional sample inspection | Lakeview Heights, Unit B-703

1. Scope and limitations

This fictional inspection report is a sample document for a Real Estate Document Intelligence RAG application. It is not based on an actual site visit and does not certify the condition, value, safety, or legal status of any property.

Illustrative inspection date: 18 December 2025. The sample checklist covers interior finishes, doors and windows, kitchen, bathrooms, electrical fixtures, plumbing, ventilation, and handover inventory. No structural testing, specialist diagnostics, or destructive testing is represented.

A real report should identify the inspector, inspection date, methods, inaccessible areas, limitations, photographs, and any referral to specialists.

2. Interior and finishes

The fictional unit is described as having painted walls, tiled flooring, fitted wardrobes in two bedrooms, and standard interior doors. A few minor scuff marks near the entry and small surface scratches on a living-room tile are listed as cosmetic observations in this example.

The sample does not establish whether any crack is structural, whether moisture exists behind a wall, or whether hidden defects are present. Any unusual crack pattern, recurring dampness, or uneven floor should be assessed by a qualified professional.

Recommended action: document pre-existing conditions with dated photographs and a room-by-room signed inventory before possession.

3. Doors, windows, balconies, and access

The hypothetical checklist recommends checking the main door, locks, internal door latches, window handles, sliding tracks, and visible glazing. The sample does not claim that these items were physically tested in a real apartment.

If a balcony is present, inspect visible railing fixings, floor drainage, and signs of water ingress. Any loose railing, cracked glass, or other safety concern should be restricted from use and assessed promptly by a qualified person.

Confirm that keys, access cards, lift access, parking tags, and emergency contact details are handed over and recorded.

Important notice: All observations are fictional examples for testing only. This is not a real inspection, engineering certificate, electrical safety certificate, or guarantee of property condition.

PROPERTY INSPECTION REPORT — PROPERTY B (continued)

Illustrative sample for a fictional property

4. Kitchen, water supply, and drainage

The illustrative kitchen contains cabinets, a sink, countertop, and space for appliances. A real inspection should check taps, drainage, under-sink connections, cabinet swelling, ventilation, and safe installation of cooking equipment.

The sample makes no claim that water pressure, drainage performance, gas connections, or appliance operation have been certified. Any gas odor or suspected leak requires immediate safety precautions and qualified assistance.

Recommended action: list each supplied appliance and note its condition, ownership, warranty status if known, and responsibility for repair or replacement.

5. Bathrooms and dampness checks

The example apartment has two bathrooms. A walkthrough should check taps, shower fittings, toilets, drainage, exhaust fans, visible grout, sealant, and signs of seepage around plumbing fixtures.

Persistent dampness, mold, loose tiles, water stains, or seepage affecting another unit should be reported to the Owner or building manager. A visual check alone cannot verify concealed waterproofing.

Recommended action: photograph existing stains and note whether the area was dry, damp, or not tested at the time of inspection.

6. Electrical and fire-safety checklist

Check accessible lights, switches, fans, sockets, and the electrical panel cover without opening energized equipment. Exposed wires, overheating, sparks, or a burning smell should be treated as urgent and referred to a qualified electrician.

Ask the building manager about fire extinguishers, alarms, emergency lighting, exit routes, lift emergency procedures, and maintenance records. This sample is not a fire-safety compliance certificate.

Do not overload electrical outlets or operate damaged equipment. Residents should know how to contact building security and emergency services.

Important notice: All observations are fictional examples for testing only. This is not a real inspection, engineering certificate, electrical safety certificate, or guarantee of property condition.

Illustrative sample for a fictional property

7. Fixtures and handover inventory

The illustrative inventory may include ceiling fans, lights, kitchen cabinets, wardrobes, bathroom mirrors, taps, and a water heater if actually supplied. Each item should be recorded as present, missing, damaged, or not tested.

At handover, record the number of keys and access cards, parking allocation, meter readings, and any building access devices. Both parties should receive the same signed inventory.

8. Priority findings and action plan

Immediate safety: address any exposed wiring, unstable balcony railing, gas odor, or blocked exit before occupancy.

Water and moisture: investigate active leaks, persistent dampness, drainage failure, and signs of seepage.

Functional items: test locks, lights, fans, taps, toilets, windows, and appliances that are included.

Cosmetic items: record the illustrative scuffs and tile scratches in the inventory so they are not confused with later damage.

9. Follow-up and sign-off

Each issue should have a description, priority, assigned person, target date, and completion note. Attach photos or service receipts when available. If an issue is not tested, mark it as 'not tested' rather than 'passed'.

Before occupancy, the Tenant and Owner should review the inventory, agree on urgent repairs, and keep copies. For a real property, seek specialist assessment where safety or structural concerns arise.

All observations in this file are synthetic sample content intended to help test PDF ingestion, semantic search, summarization, and comparison in a RAG application.

Important notice: All observations are fictional examples for testing only. This is not a real inspection, engineering certificate, electrical safety certificate, or guarantee of property condition.
